

FitzWright Lifejacket Light W4-A

FitzWright takes great pride in introducing our latest range of lifejacket lights and a pioneering concept in lifejacket illumination. We understand the paramount importance of safety at sea, and we're dedicated to providing cutting-edge solutions.

The Power of Lithium Technology

At FitzWright, we continue to endorse lithium-based technology for survivor location lights due to its exceptional capabilities. Lithium batteries offer unmatched power, resilience in extreme temperatures, and extended life once activated. Our renowned M3/W3 range, for instance, boasts a remarkable runtime of nearly 90 hours at the required 0.75cd light output.

Introducing the Alkaline Range

As environmental concerns grow and transportation costs rise, we recognize the need to offer our customers a choice of battery technologies. Our new Alkaline range meticulously meets all the rigorous testing requirements of SOLAS and the Marine Equipment Directive, providing a substantial 60 hours of illumination, far exceeding the mandatory 8 hours.

Freedom to Choose

Our new range is 100% approved, and we believe in empowering our customers with choices. You can now select from two top-tier lights, depending on your priorities, whether it's transportation, disposal, or performance.

W4-A: Your Automatic Solution

The W4-A is the automatic counterpart to the M4-A. This innovative light activates automatically upon contact with water and can be manually turned off if needed. It's designed to enhance your safety and peace of mind while on the water.

FitzWright is your trusted partner in marine safety, and the W4-A Lifejacket Light is a testament to our commitment to excellence. Choose FitzWright for superior safety solutions.
