

Pneumatic Fender

TekMarine TJCQ Pneumatic Fenders are highly successful for ship-to-ship operations and for large tidal variations. They provide temporary or permanent protection and are simple to deploy.

Their low hull pressure and reaction, rough weather performance and durability make TJCQ Pneumatic Fenders favorites for naval use.

Pneumatic fenders also cope well with shear and with bow flares – energy absorption is unchanged at compression angles of up to 15°. They maintain a high, stable standoff.

Pneumatic fenders are easy to transport. They can be shipped and stored deflated.

Available in many sizes, either 50kPa or 80kPa initial internal pressures, and with optional chain-tire nets, there is a pneumatic fender for any application. Black and naval gray finishes are available for all sizes.
