

NOFI BoomBag

The speed of the first response often determines whether the oil spill remains a minor incident, or if it develops into a more costly spill. The NOFI BoomBag is specially designed for fast response with minimal requirements for boats and personnel.

The ECOSOLID boom is packed in a zigzag pattern inside the NOFI BoomBag. The [ECOSOLID](#) series oil containment boom is a new design using solid flotation, all new regulations considered, it is reliable, robust and a high visibility oil boom. The NOFI BoomBag may be stored on the quayside for immediate deployment. It may also be stored on a trailer for transportation on land or in a warehouse using a forklift for transportation to the quayside in case of an oil spill situation.
