

Boom Fender

Containment boom anchored around a vessel's hull or near a bulkhead can be damaged and torn by the constant rubbing and chafing against the steel or concrete surface. Protect your boom with the ABASCO Boom Fender which maintains the boom a safe distance away. Also, by maintaining separation, spills will be more effectively contained as spilled liquids will have more surface area to spread out.

The ABASCO Boom Fender is a three-legged floating frame. Each leg is approximately 10 ft (3m) long and has rubber floats/bumpers at each end and one in the center. The floats/bumpers are made from tough, abrasive-resistant two-ply rubber that will withstand the chafing and pounding against a concrete or barnacle-encrusted surface.

Boom Fender legs are connected with stainless steel hardware. The frame is easily broken down for convenient storage and handling. Set up and deployment can be done in minutes by one man.
